

Earthquake Early Warning
- Information before strong ground motion -

Mitsuyuki HOSHIBA

Japan Meteorological Agency

January 12 , 2007

Distribution of Earthquakes Causing Tsunami (1896~2004) in Japan

**Distribution of Earthquakes causing damages
(1900~2001, $M \geq 5.0$, Depth < 100km)**

Earthquake Information *at present*

- Seismic Intensity Information
- Location of the Earthquake, and Magnitude
- Tsunami Warning / Advisory

From JMA

Information after the disaster
(post-disaster information)

Information *before* the strong ground motion
=> Earthquake Early Warning (EEW)

Before explanation of EEW, current earthquake
information is briefly explained.

JMA Seismic Intensity Scale

Measurement of Seismic Intensity

Seismic Intensity Measurement Stations

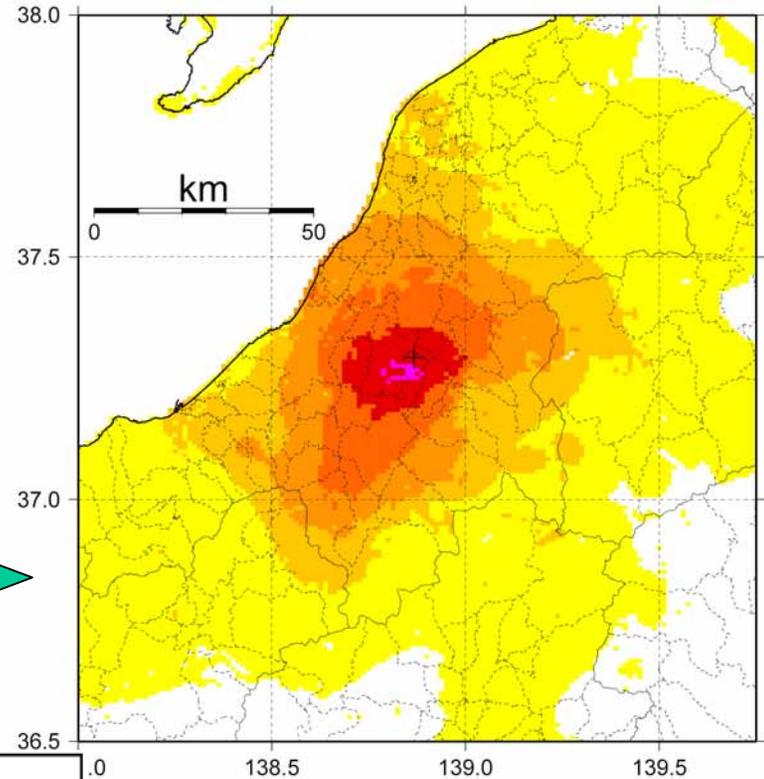

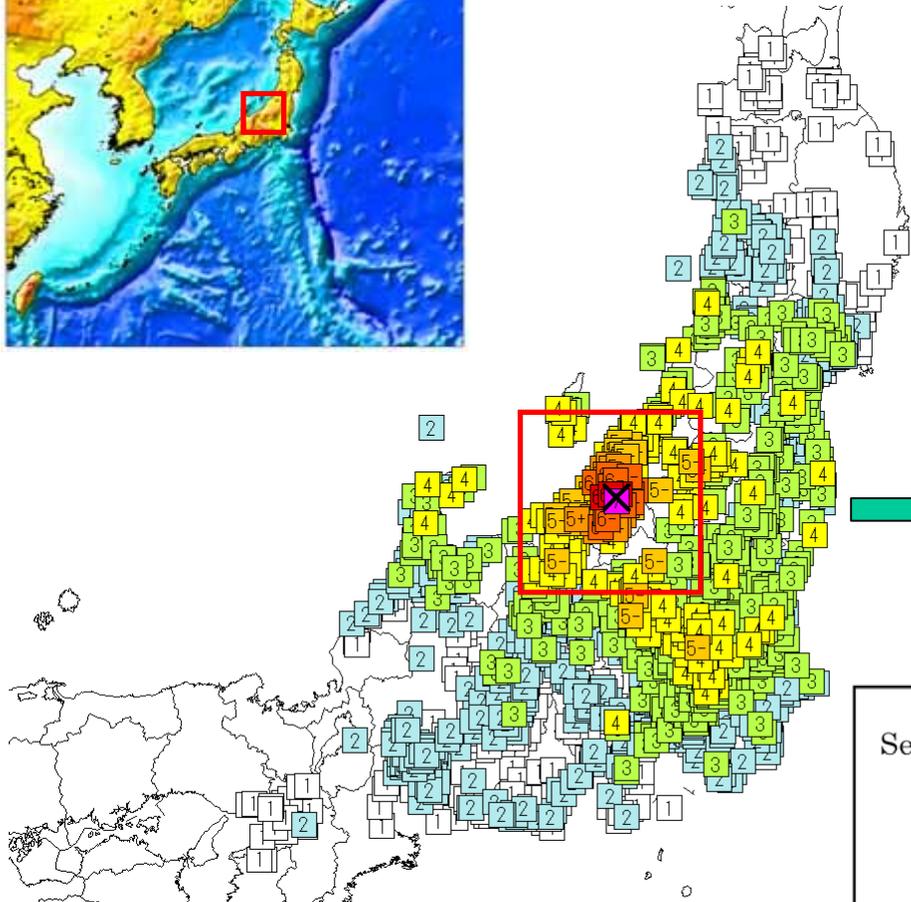

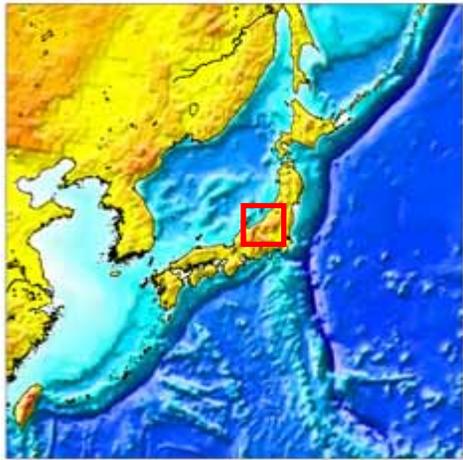

- JMA (600)
- Municipalities (2,849)
- ▲ NIED(K-NET) (667)

Total : about 4,000

Seismic Intensity

The Mid Niigata Prefecture Earthquake (M6.8, Oct., 23, 2004)

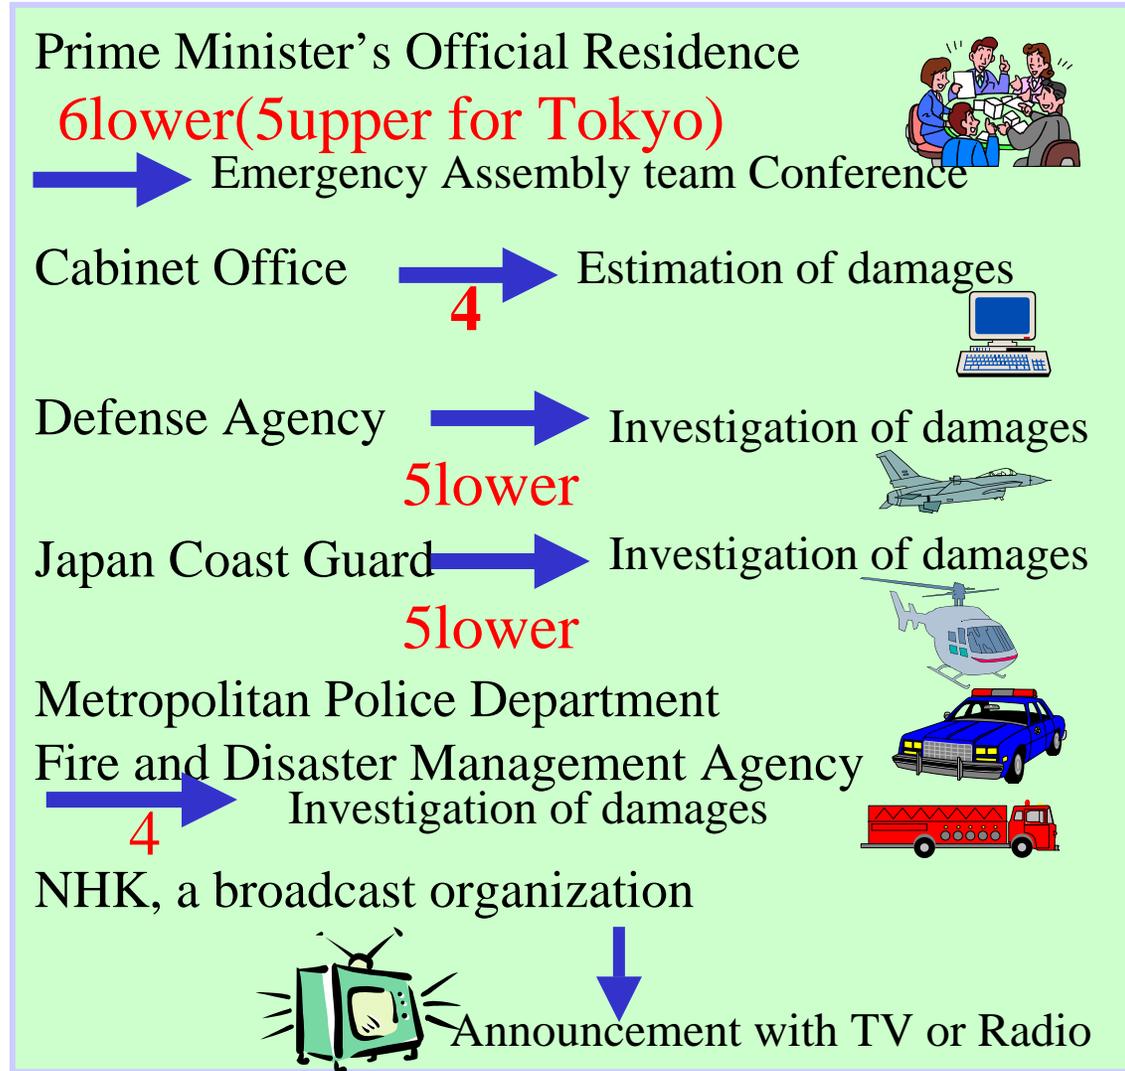

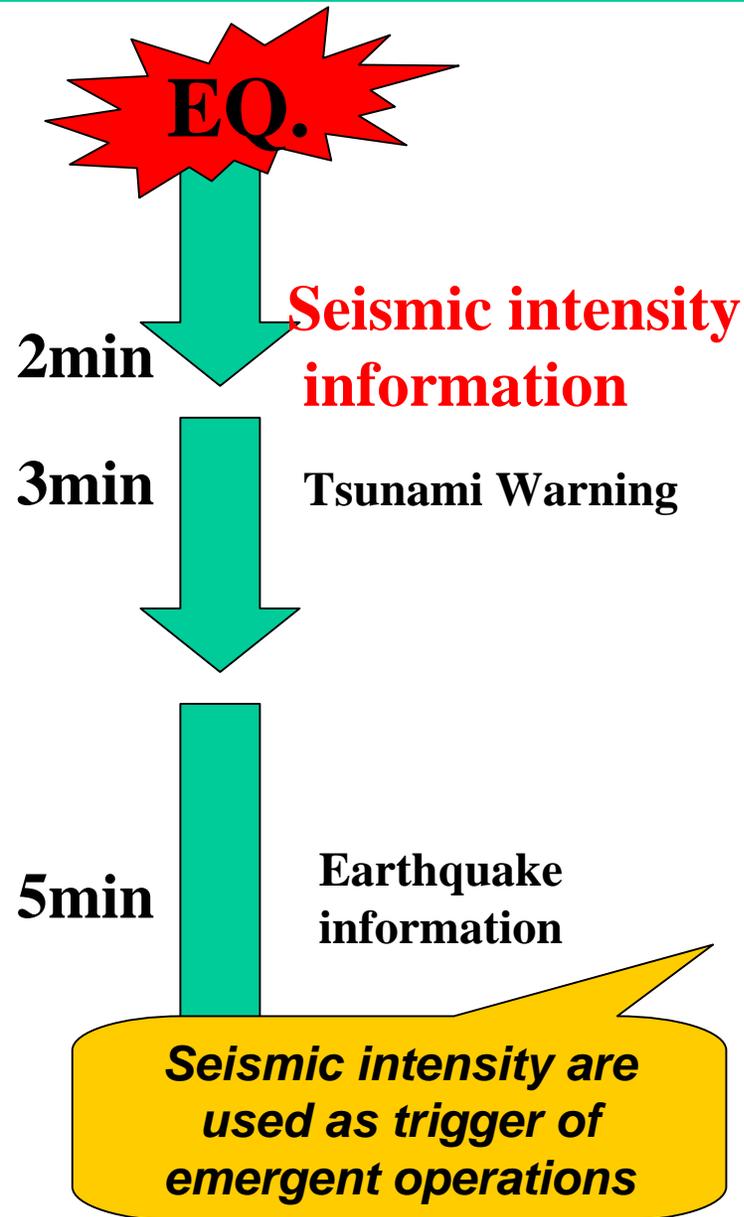

| Notes | |
|-------------------|--------|
| Seismic Intensity | |
| 7 | 7 |
| 6+ | 6upper |
| 6- | 6lower |
| 5+ | 5upper |
| 5- | 5lower |
| 4 | 4 |
| 3 | 3 |
| 2 | 2 |
| 1 | 1 |

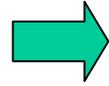

Max. Intensity = 7

Seismic Intensity Distribution

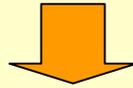

Emergency Operation by Seismic Intensity Information

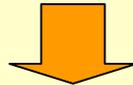

When the Earthquakes occurs in Japan

For more mitigation of earthquake disaster

If we can be aware of earthquake occurrence in advance, it is useful to take appropriate procedures to avoid dangerous situation for prevention of disasters.

However, earthquake prediction is still quite difficult.

Earthquake Early Warning

If we can be aware of earthquake occurrence very quickly, especially before strong shaking, it is useful to take appropriate procedures to avoid dangerous situation for mitigation of disasters.

*JMA intends to start a new
service on earthquake
information*

- Earthquake Early Warning -

***Information before strong ground
motion of earthquake***

EEW Methods

(Hypocenter, Magnitude, Seismic Intensity)

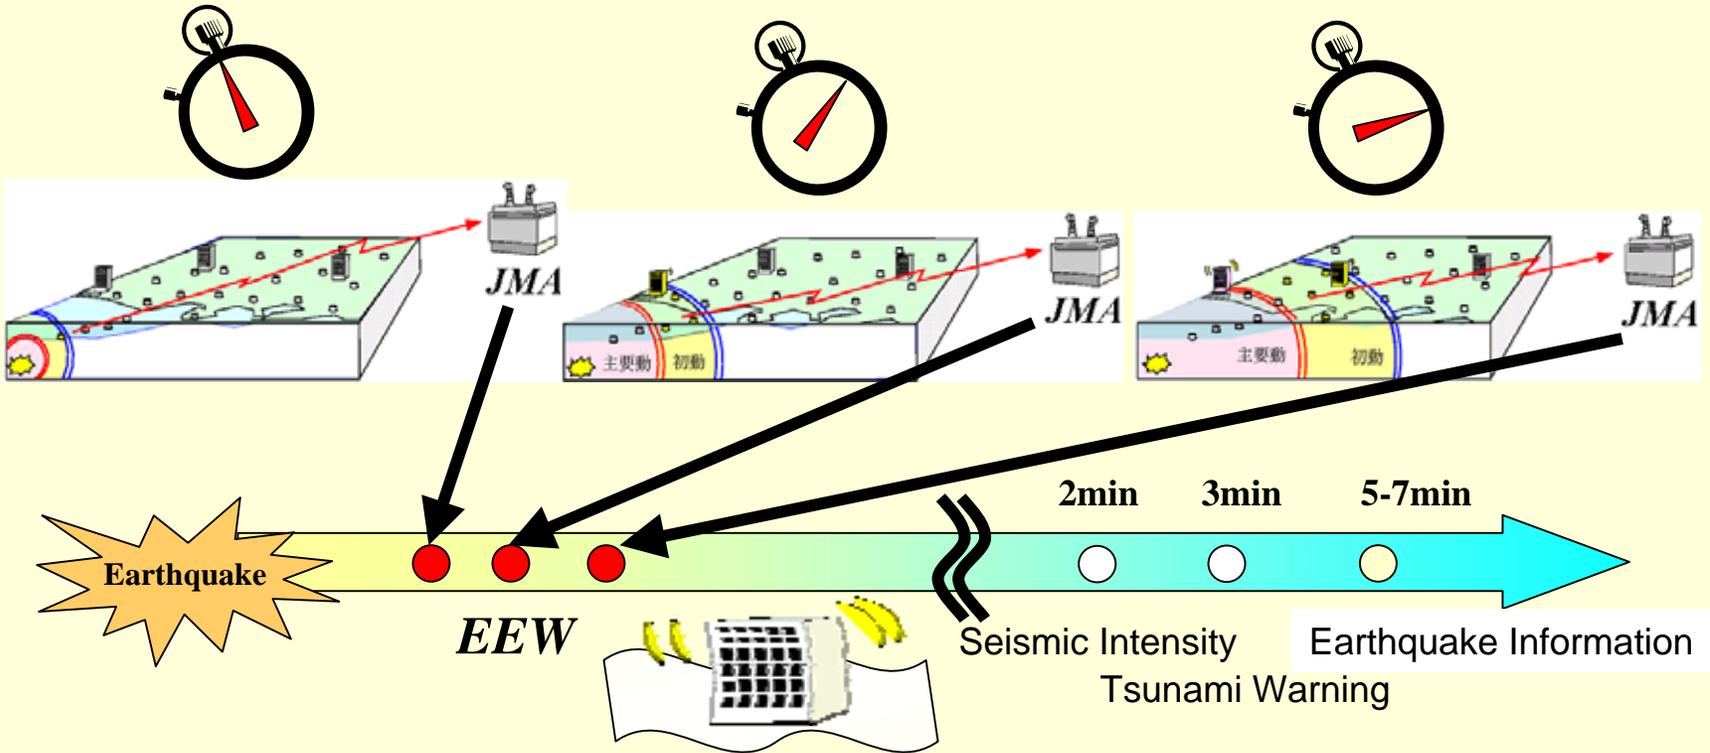

1. Hypocenter estimation

1) Single station method

2) Network method

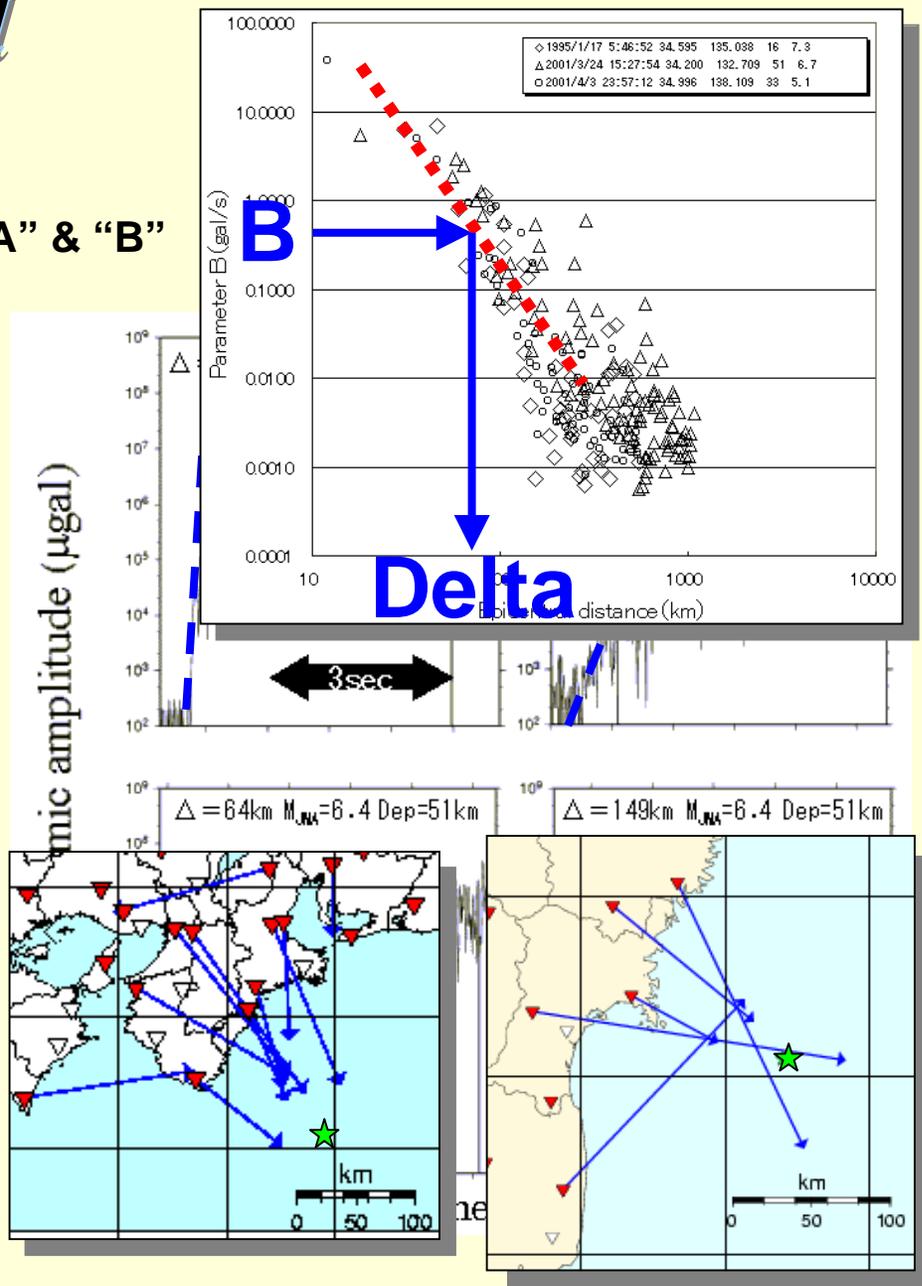

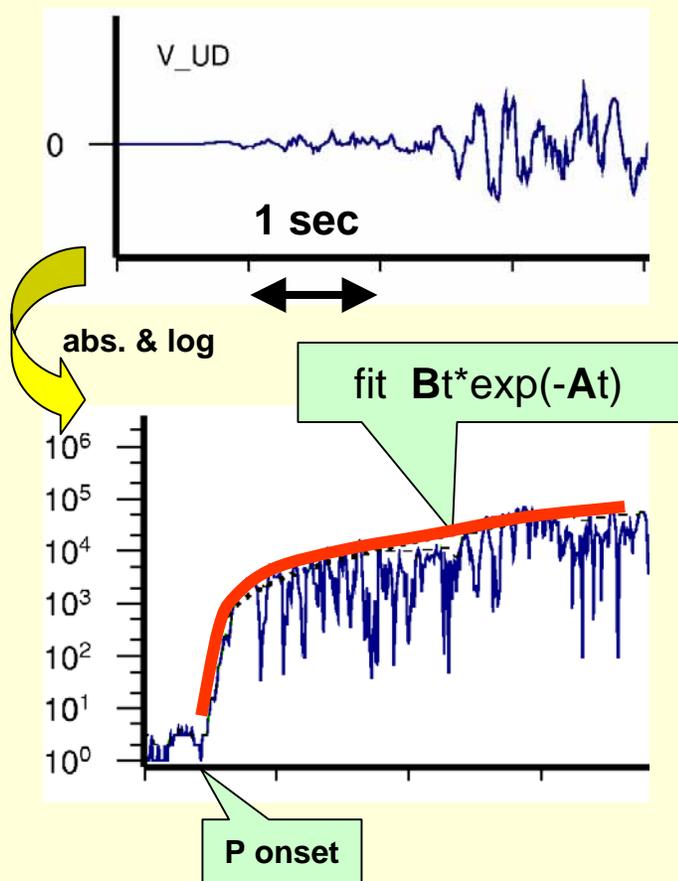

2. Magnitude estimation

3. Seismic intensity estimation

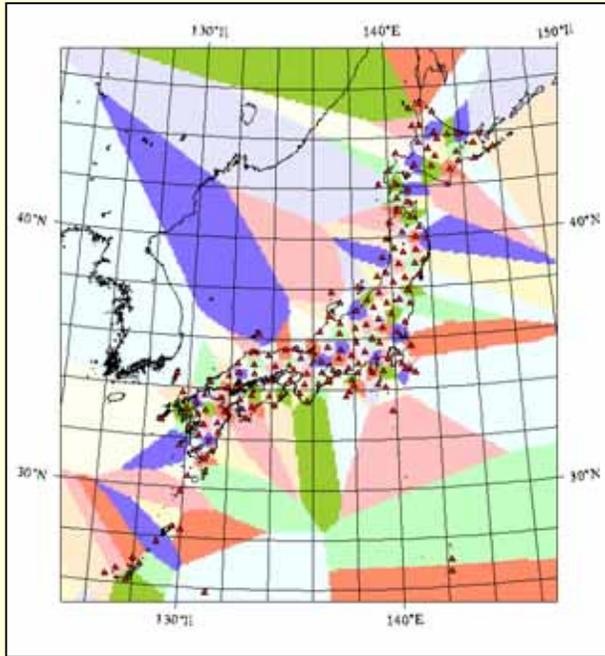

Single Station Method

Extraction of waveform character -> "A" & "B"

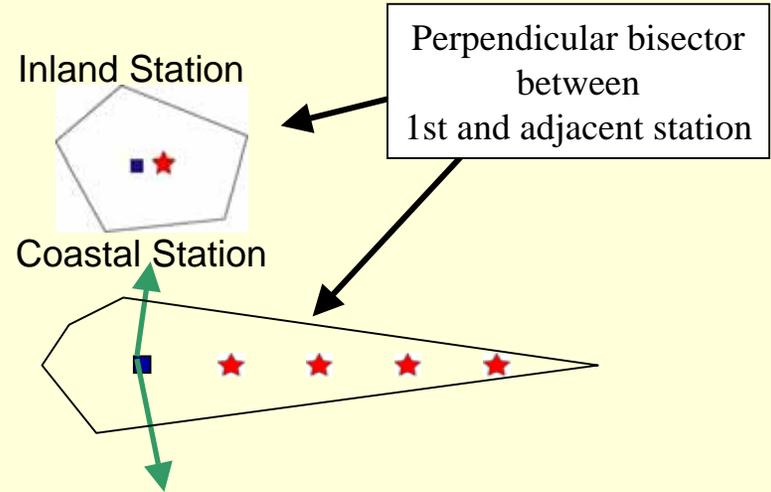

Network Method(1) - Territory

Territory status

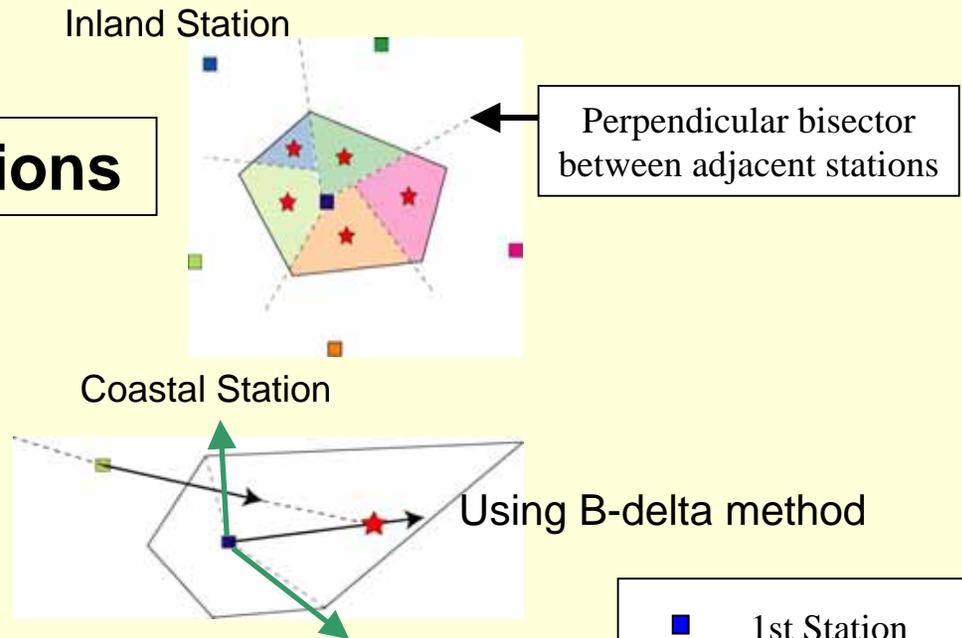

Updated every time
“dead or alive” at
about 200 stations

1st station

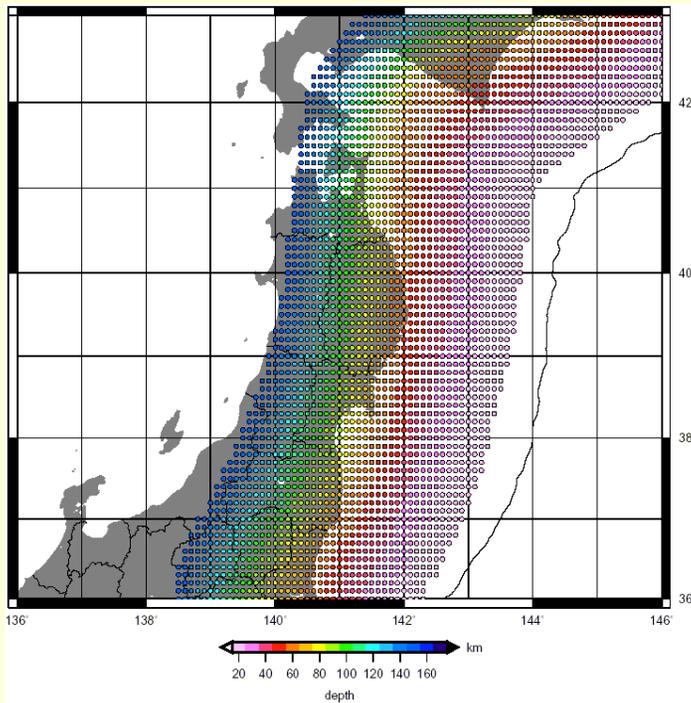

2 stations

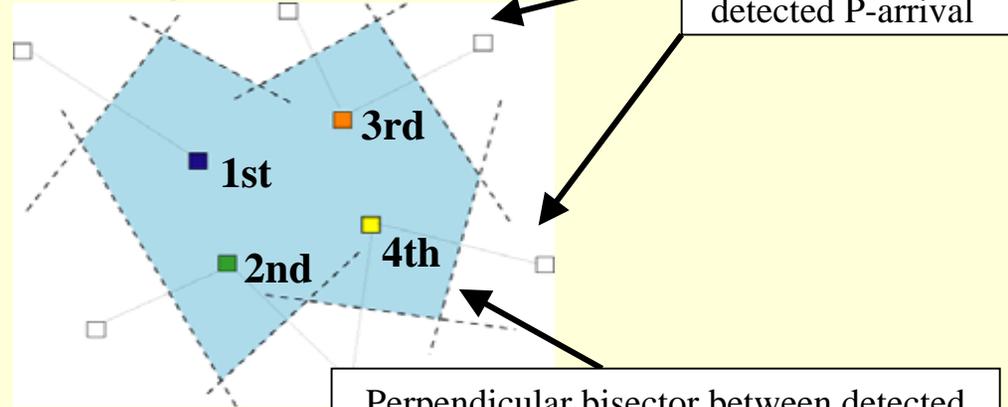

- 1st Station
- ★ Each Centroid
- Critical Angle

Network Method(2) - GridSearch

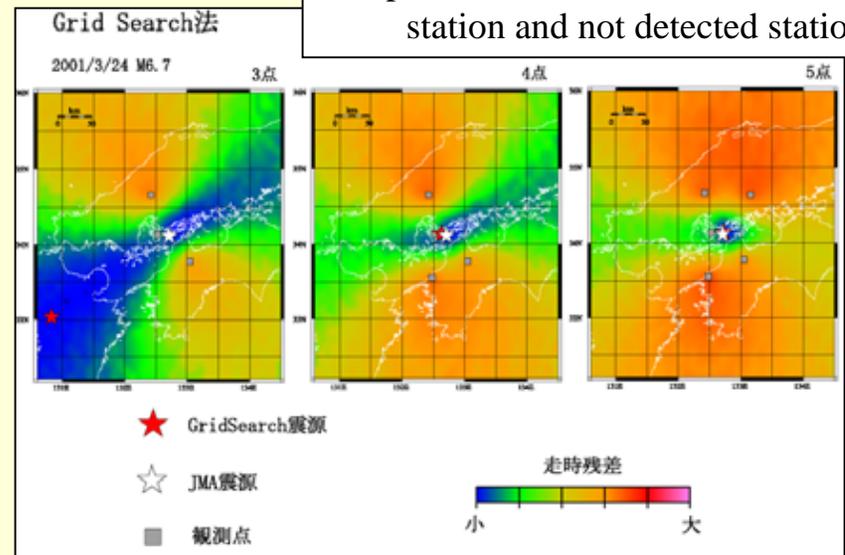

at every 0.1 degree horizontally
and 10km vertically

Region limitation
of grid search

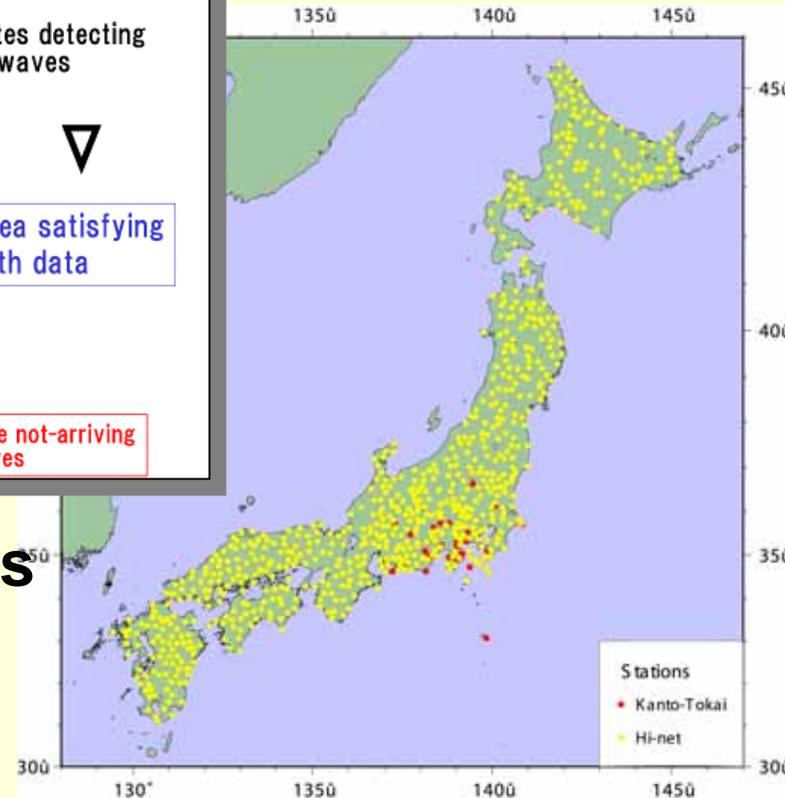

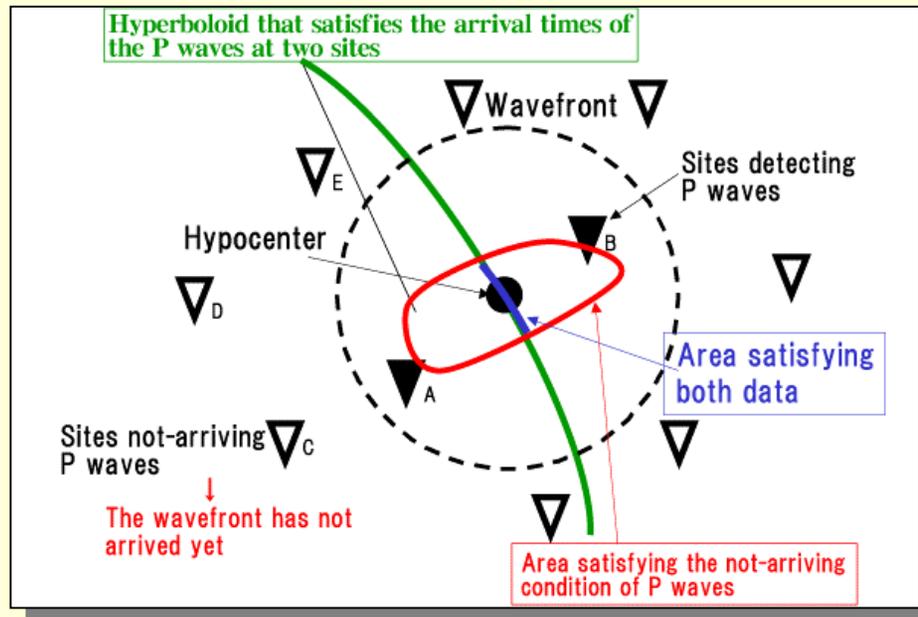

Perpendicular bisector between detected
station and not detected station

Network Method(3) - Not Yet Arrived Data

Developed by Horiuchi et al., NIED

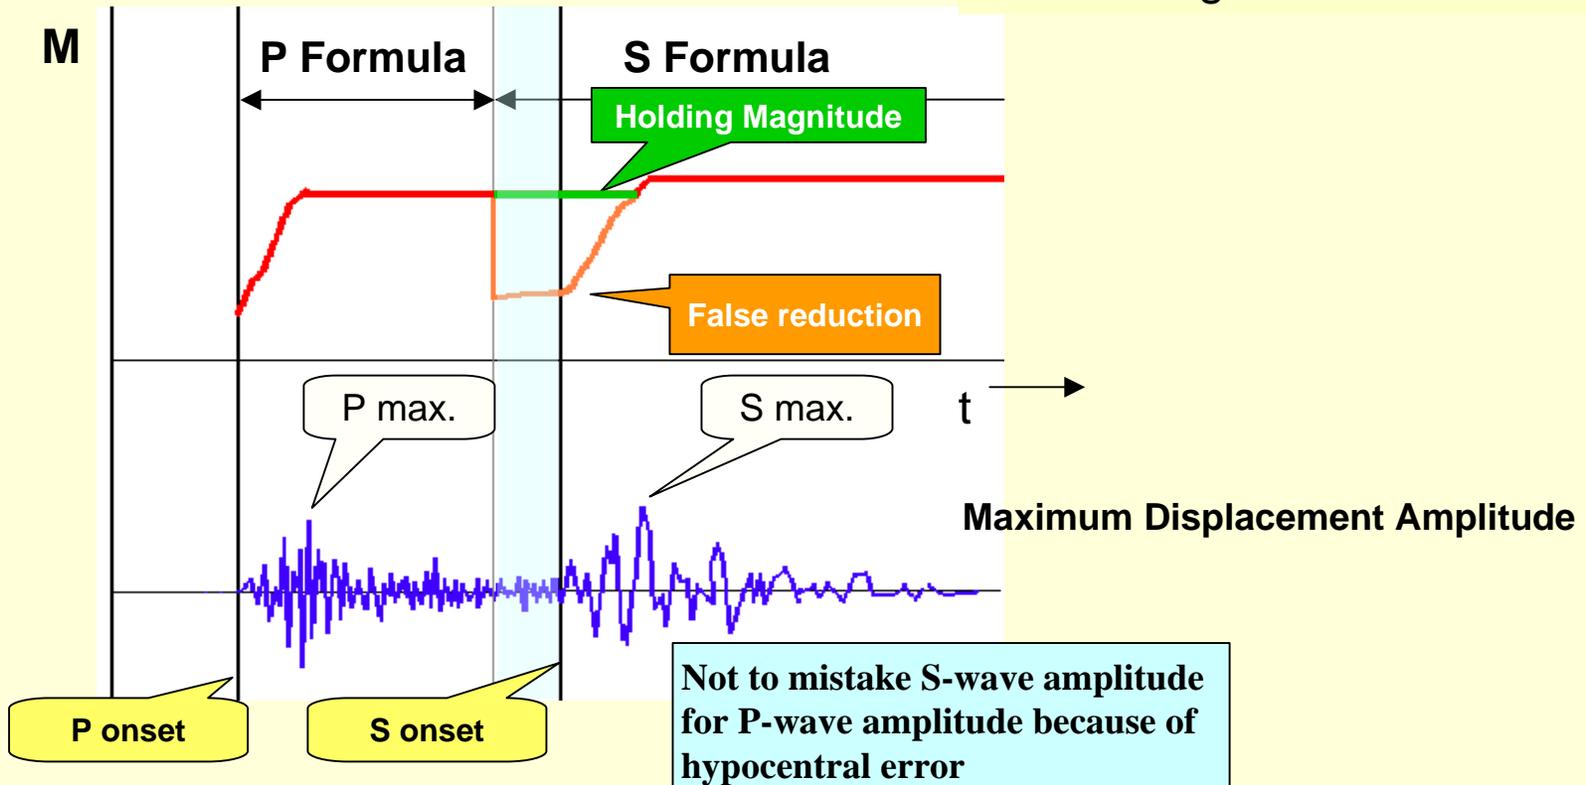

More than 2 stations

Use Hi-net (NIED)

Integrate from Jun. 2005

Magnitude Estimation

Event magnitude is average of station magnitude

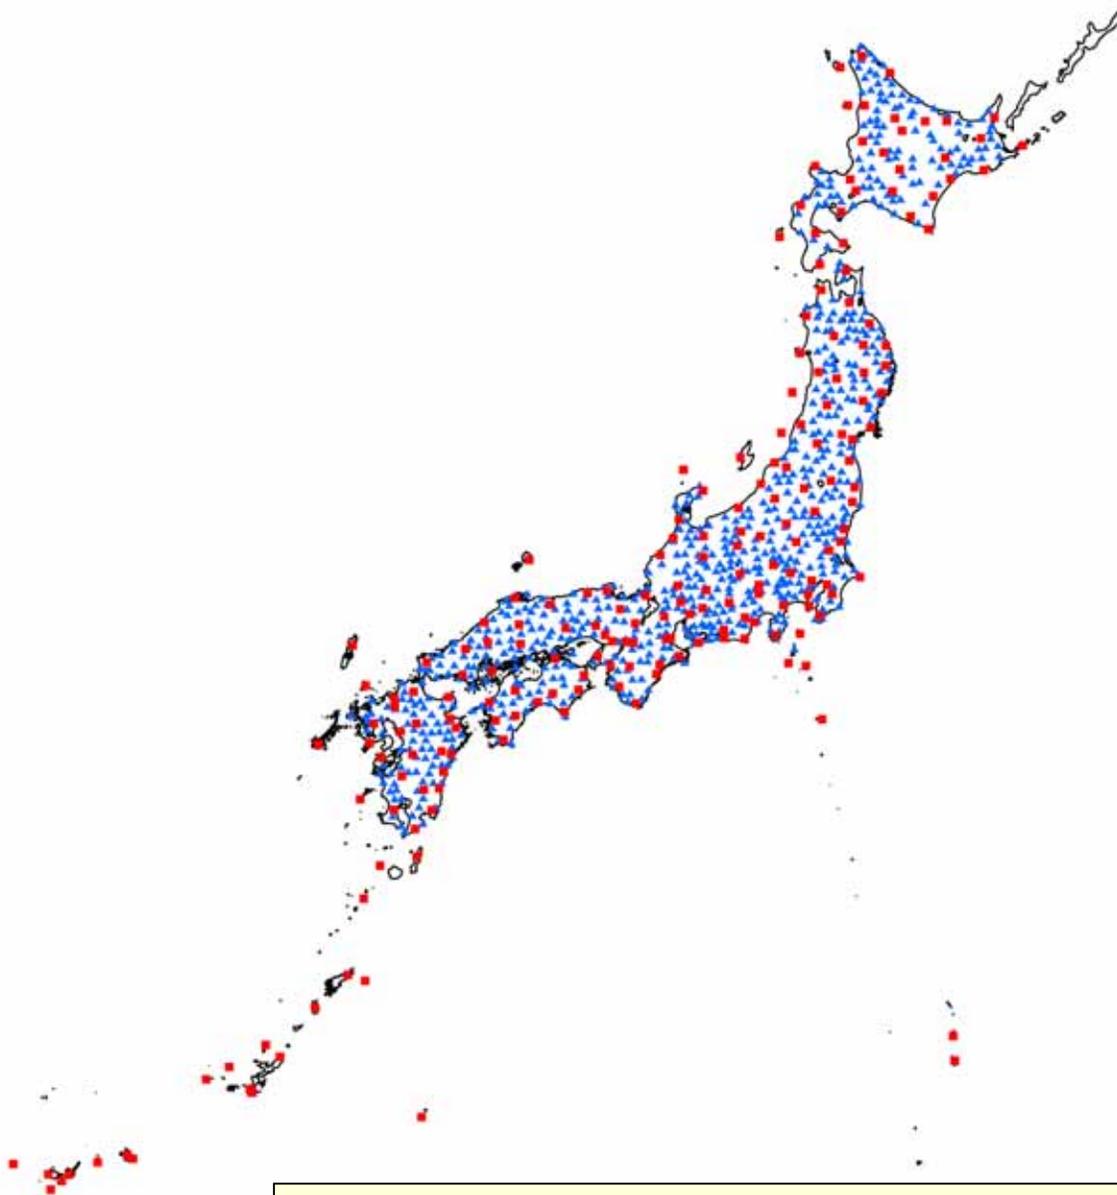

$$\text{P Formula } M = \log D_{\max} + \log R + 6.12 \times 10^{-4} \times R + 2.58$$

$$\text{S Formula } M = \log D_{\max} + \log R + 9.53 \times 10^{-4} \times R + 1.74$$

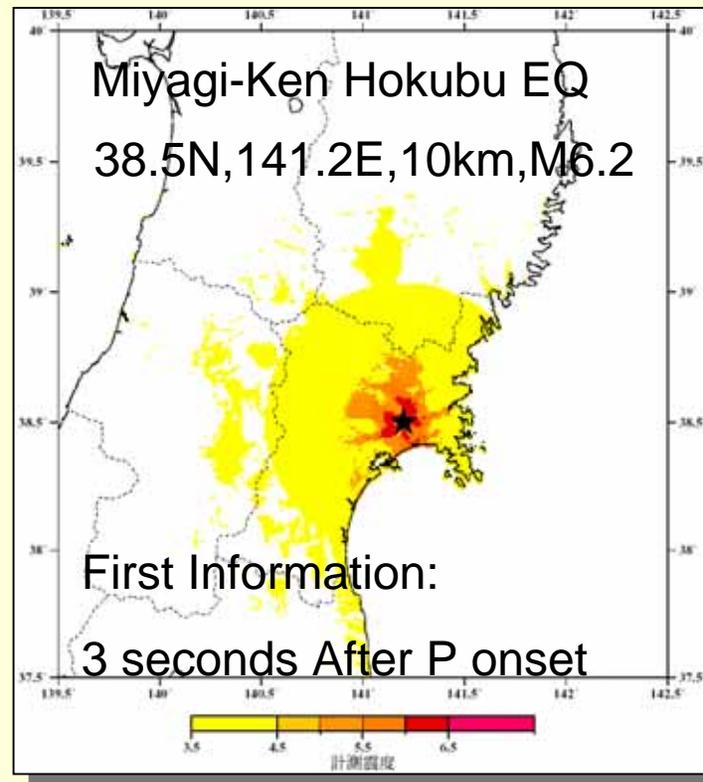

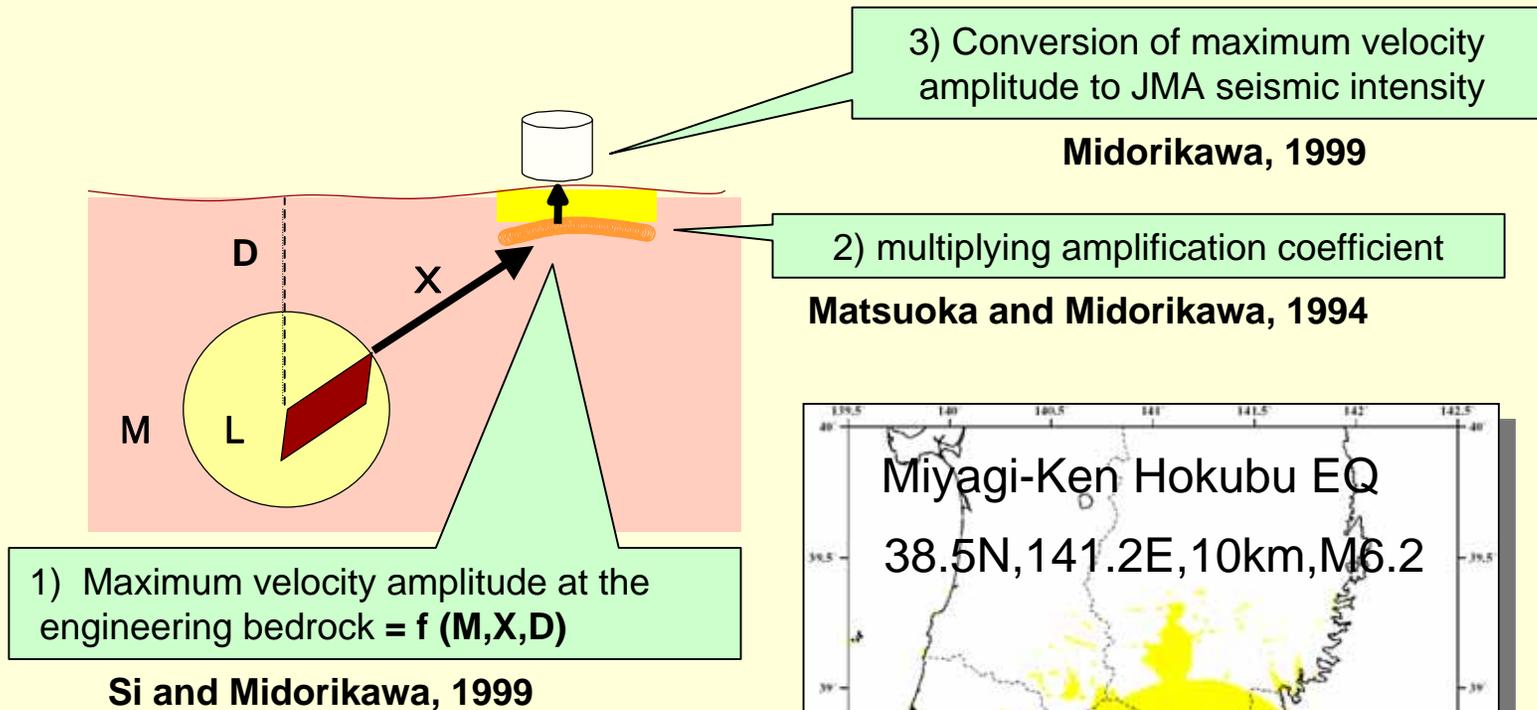

D_{\max} : 3-dimensional vector summation of displacement

R: hypocentral distance

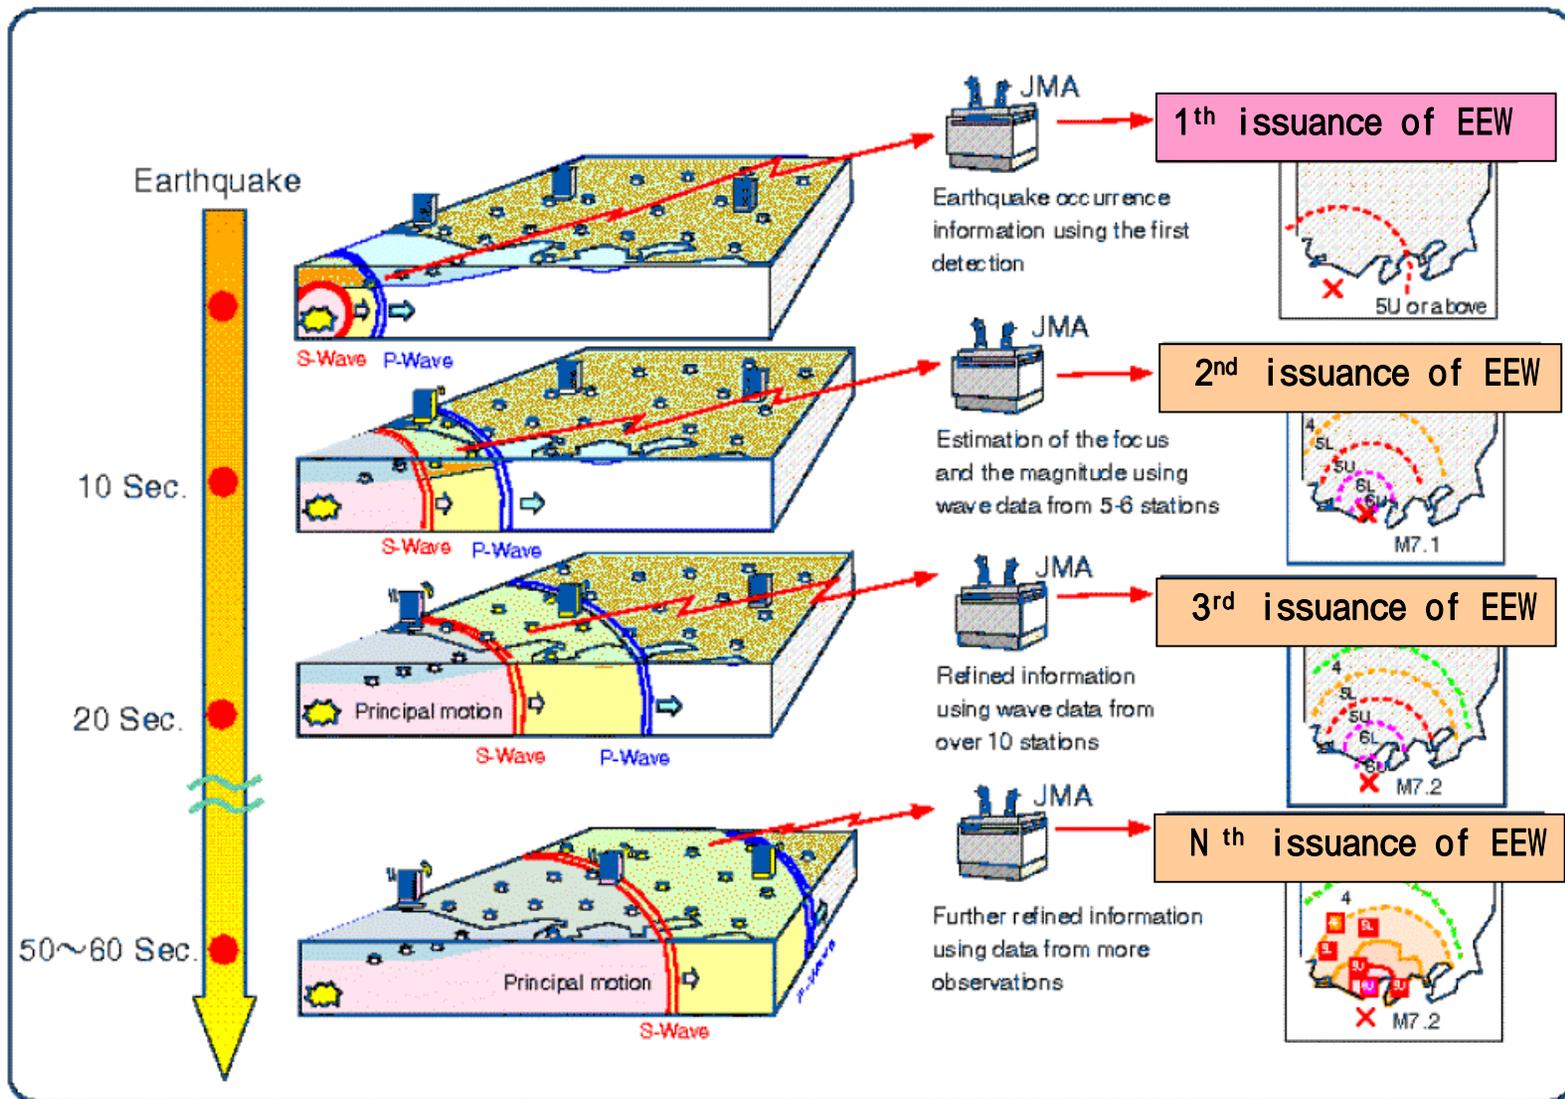

Stations used for Earthquake Early Warning
(:JMA, :Hi-net(NIED))

Seismic Intensity Estimation

Conceptual Image of Seismic Wave Propagation and Earthquake Early Warning

Dissemination

Dissemination Criteria

Over 3.5 for magnitude or 3 for JMA seismic intensity scale.

1) The first warning

The result using 2seconds waveform or
Onsite warning over 100cm/s/s (without hypocenter information)

2) The cancel report

There is no following P phase detection at the closest station.

3) The updated warnings

Threshold Change 0.2 degrees for latitude and longitude,
 20km for hypocentral depth,
 +0.5, -1.0 for event magnitude
 +0.5, -1.0 for maximum seismic intensity.

4) The final warning

when the estimated magnitude value converged, or when the pre-set time has passed after the first detection of the P phase.

Feb., 2004 to July, 2006

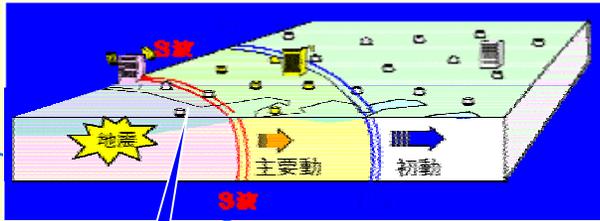

Total: 855 alarms

➡ 26 cases are false alarms

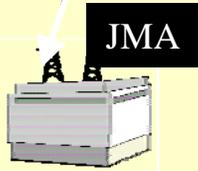

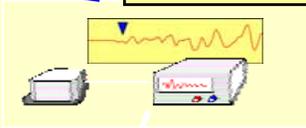

For the cases that more than 2 stations are used :

➡ No false alarms

Earthquake Early Warning (EEW)

Detection of seismic wave near the epicenter

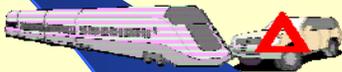

Issuance of EEW

Transmission

Usage

Public transportations, elevators and others

Avoiding dangerous situation by automatic suspension

防災関係機関

Emergency services against disaster

公共施設

Safety at hospitals and schools

住民

Automatic cut-off gas, heating equipment etc., Evacuation

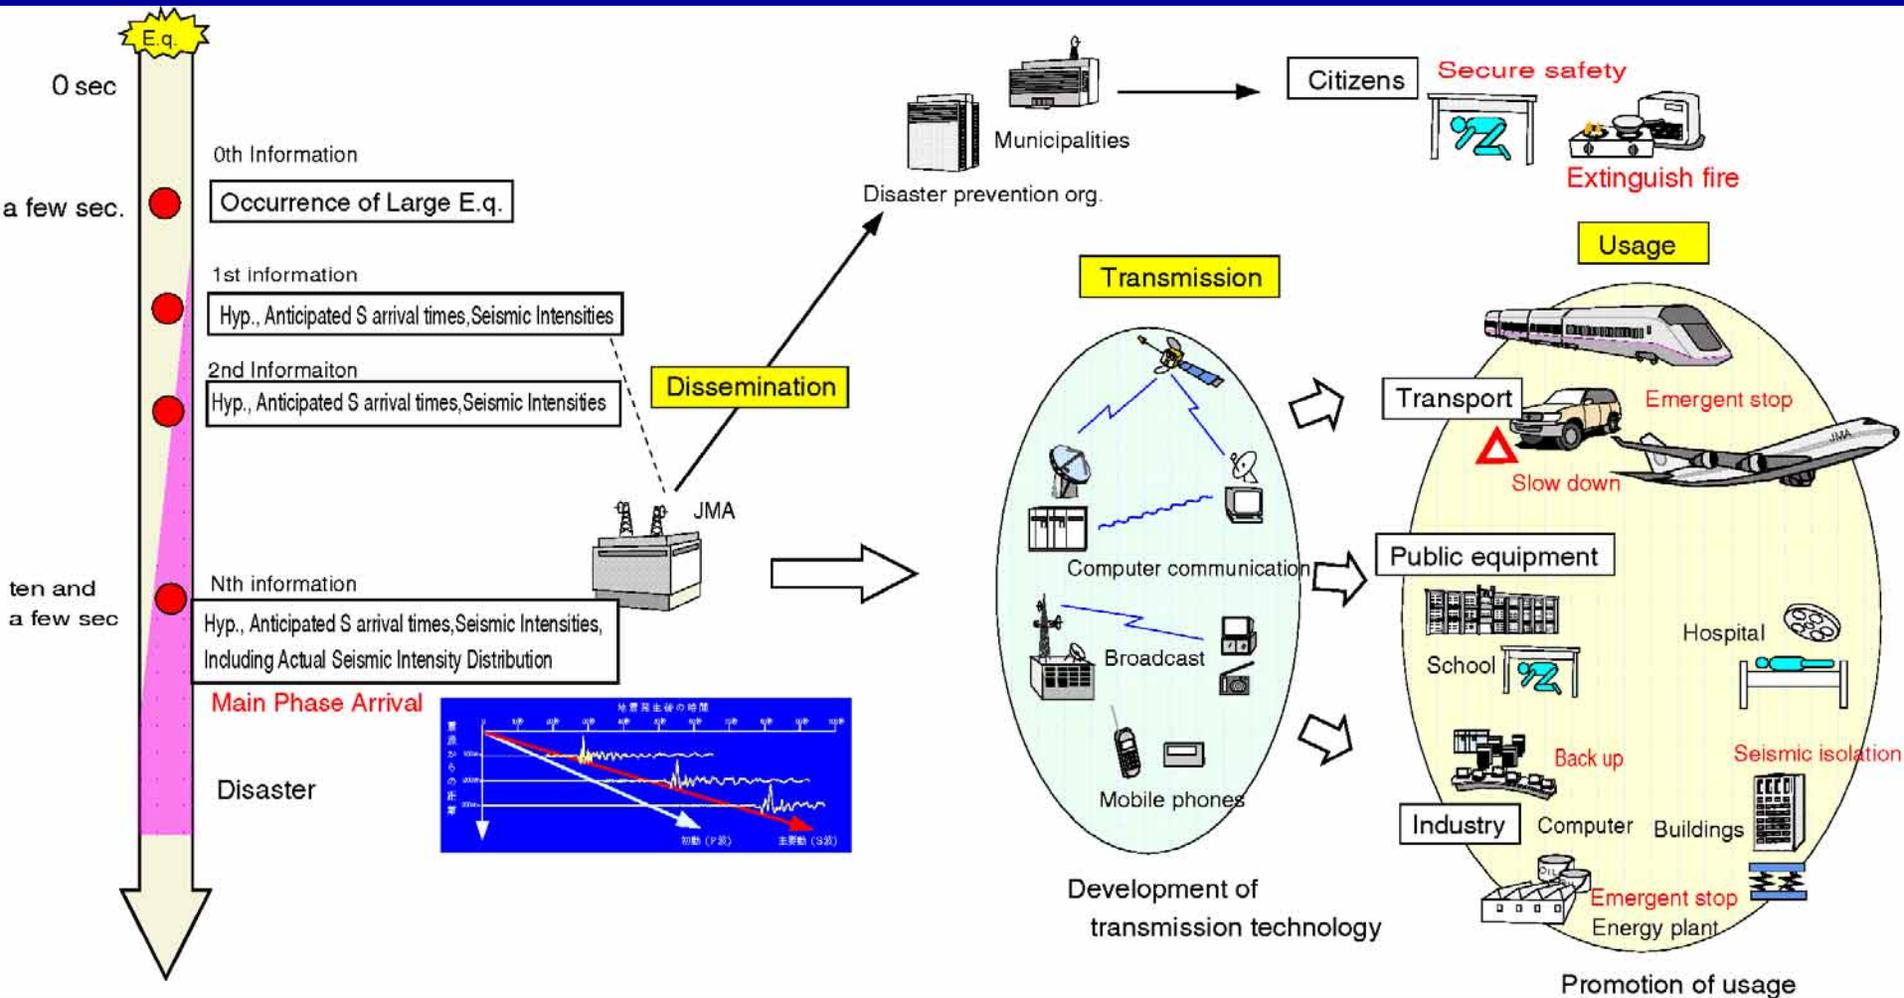

Factories and offices

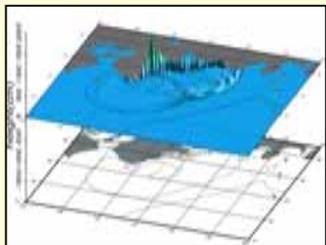

Mitigation of damage to facilities, Emergent suspension, Automatic backup of important data, Safety of workers

Example of Application of Earthquake Early Warning

Application of Earthquake Early Warning

Tsunami warning

Closing of the slide
Against Tsunami

Early Evacuation from Tsunami

Precaution measures for home / school / hall / shopping mall / etc.

Train Control System

Control Traffic Signals,
Regulation of Traffic

Lift Control System

Hospital
Prevent Mistake in
the Operation

Vibration Control Engineering

Person in Dangerous
Place
Make Safe

Broadcast

Lead Time to Strong Motion by EEW M7.2 (16 August 2005, Off Miyagi Pref.)

11:46:26 Origin Time

11:46:41 First Detection

11:46:45 1st EEW

Hypocenter, Magnitude, and Seismic Intensity

11:46:45 2nd EEW

updated EEW

.....

11:47:51 Final EEW (8th)

11:48 *Seismic Intensity Information*

11:50 *Tsunami Advisory*

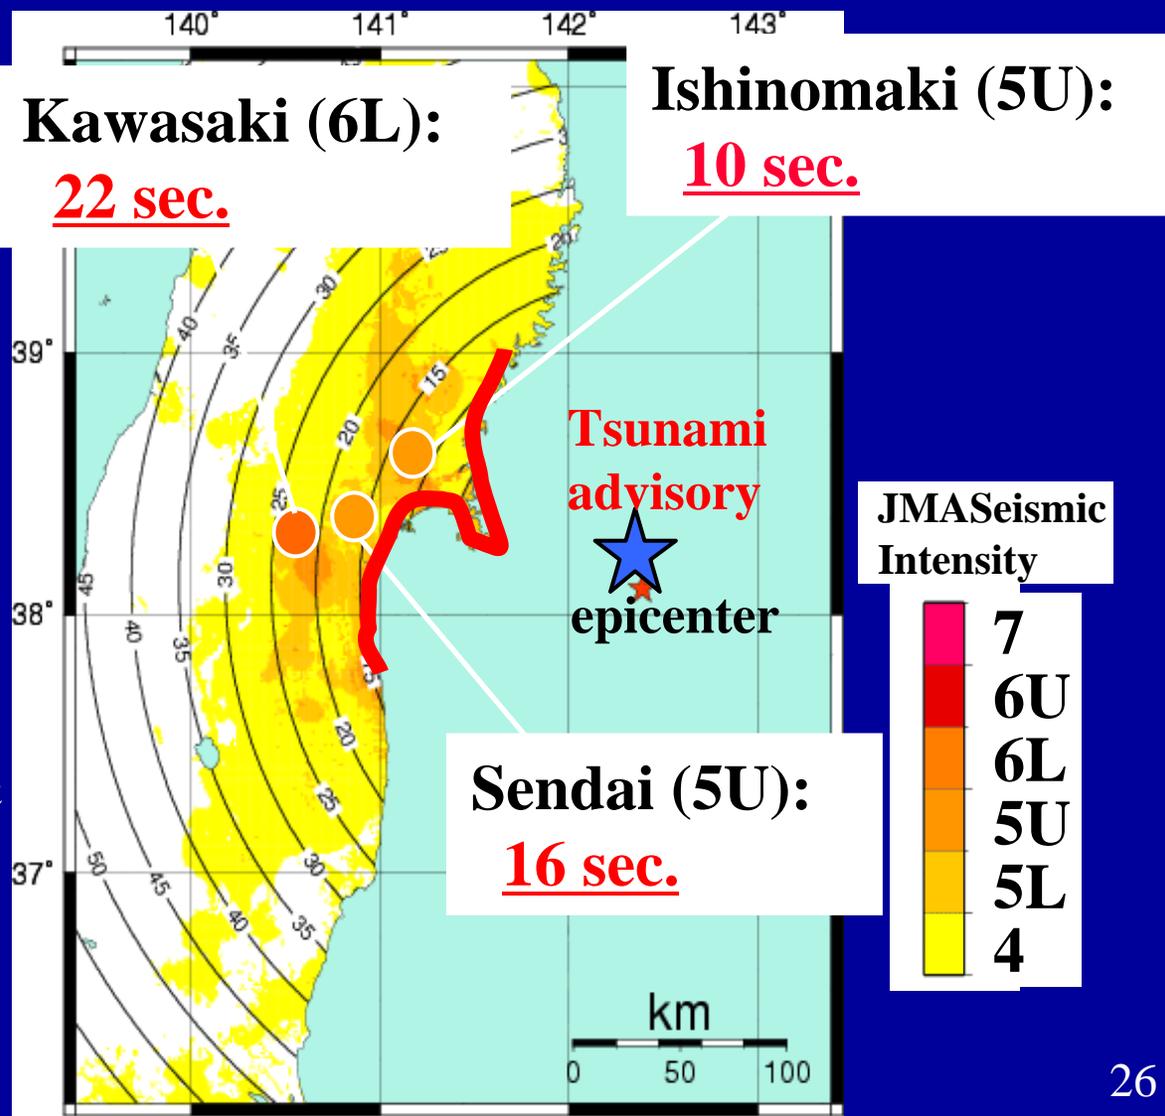

11:54 *Earthquake Information*

12:12 *13cm tsunami*

(at Ayukawa)

13:15 *Tsunami Cancellation*

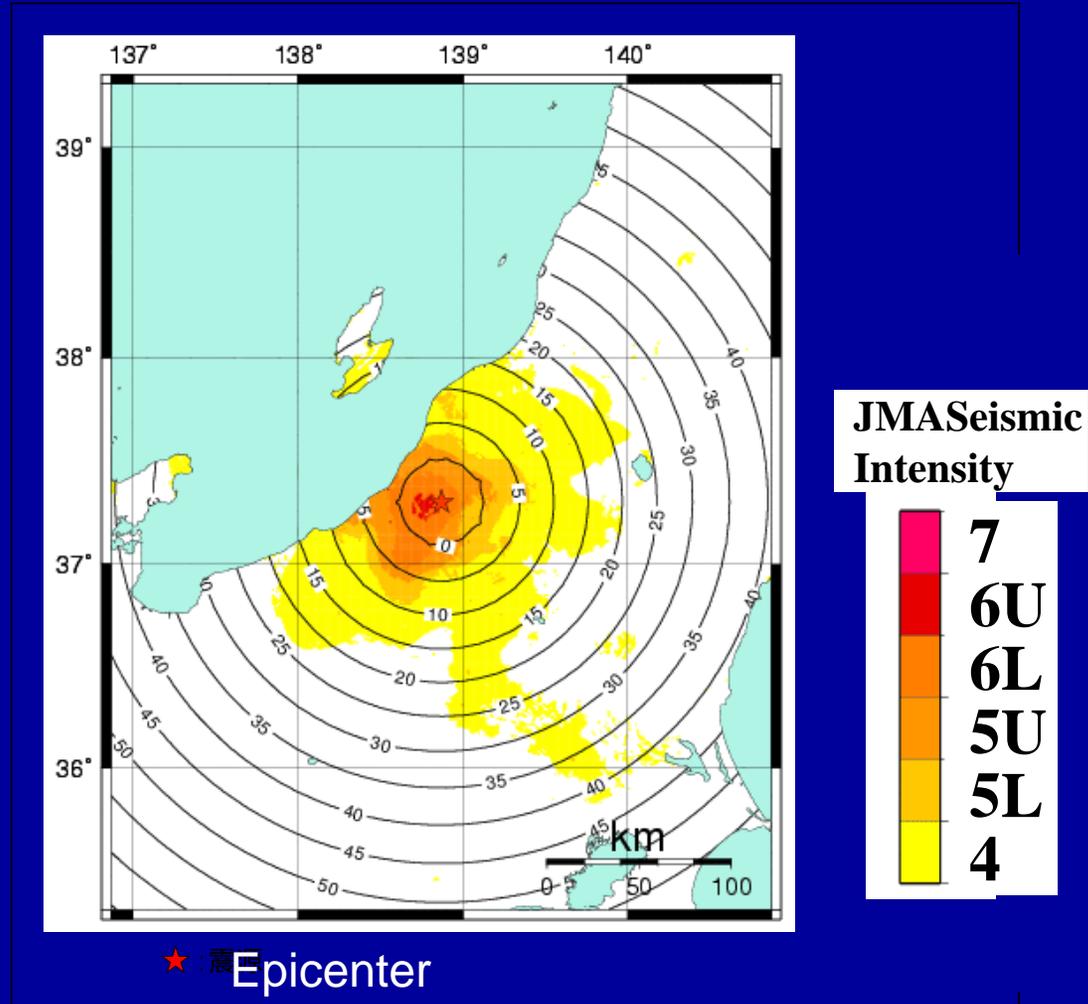

Lead Time

Lead Time to Strong Motion M6.8 (23 October 2004, Mid Niigata Pref.)

Lead Time

- 17:56:00** Origin Time
- 17:56:03** First Detection
- 17:56:04** 1st EEW
Onsite warning(over 100cm/s/s)
- 17:56:07** 2nd EEW
Hypocenter, Magnitude, and Seismic Intensity
-
- 17:57:03** Final EEW(8th)
- 17:58** *Seismic Intensity Information*
- 18:02** *Earthquake Information*

Examples of Application of EEW

© Odakyu Electric Railway

Furnished by Prof. Motosaka

© JEITA

Progress of EEW Project

- 2000- Development of EEW Technology
(with Railway Technical Res. Inst.)
- 25 Feb 2004 Start of Trial Provision
(For Kanto-Tokai-Nankai Area)
- 28 Mar 2005 Expansion of Trial Provision Area
(For Hokkaido-Tohoku Area)
- Jun 2005 Integrated use of 'Not Yet Arrived Data Method'
(Algorithm Developed at NIED into EEW)
- 31 Mar 2006 Expansion of Trial Provision Area
(For Whole Country)
- 1 Aug 2006 Start of Interim Provision to Registered Corporations
- ? ? 2007 Start of Provision to the Public

855 times (including 26 times false alarms)

Number of Registered Corporations

JMA started official service for limited fields of application in August, 2006.

| Field | Number |
|--------------------------|--------|
| Local governments | 17 |
| Universities, Institutes | 16 |
| Railway companys | 8 |
| Elevator companies | 3 |
| Power companies | 7 |
| Construction companies | 10 |
| Manufacturing industries | 51 |
| Communication | 12 |
| Broadcast | 23 |
| Information | 10 |
| Finance companies | 7 |
| Real estate agents | 10 |
| Medical institutions | 5 |
| Others | 45 |
| Total | 224 |

- **The purpose is for the control of their own facilities.**
- **The actions are already determined when EEW is received.**

- **EEW are Issued several times for each earthquake**

As of November 2, 2006

Earthquake Early Warning for the Public

Criterion for Issuing

- Estimated Maximum Seismic Intensity 5 lower

Contents

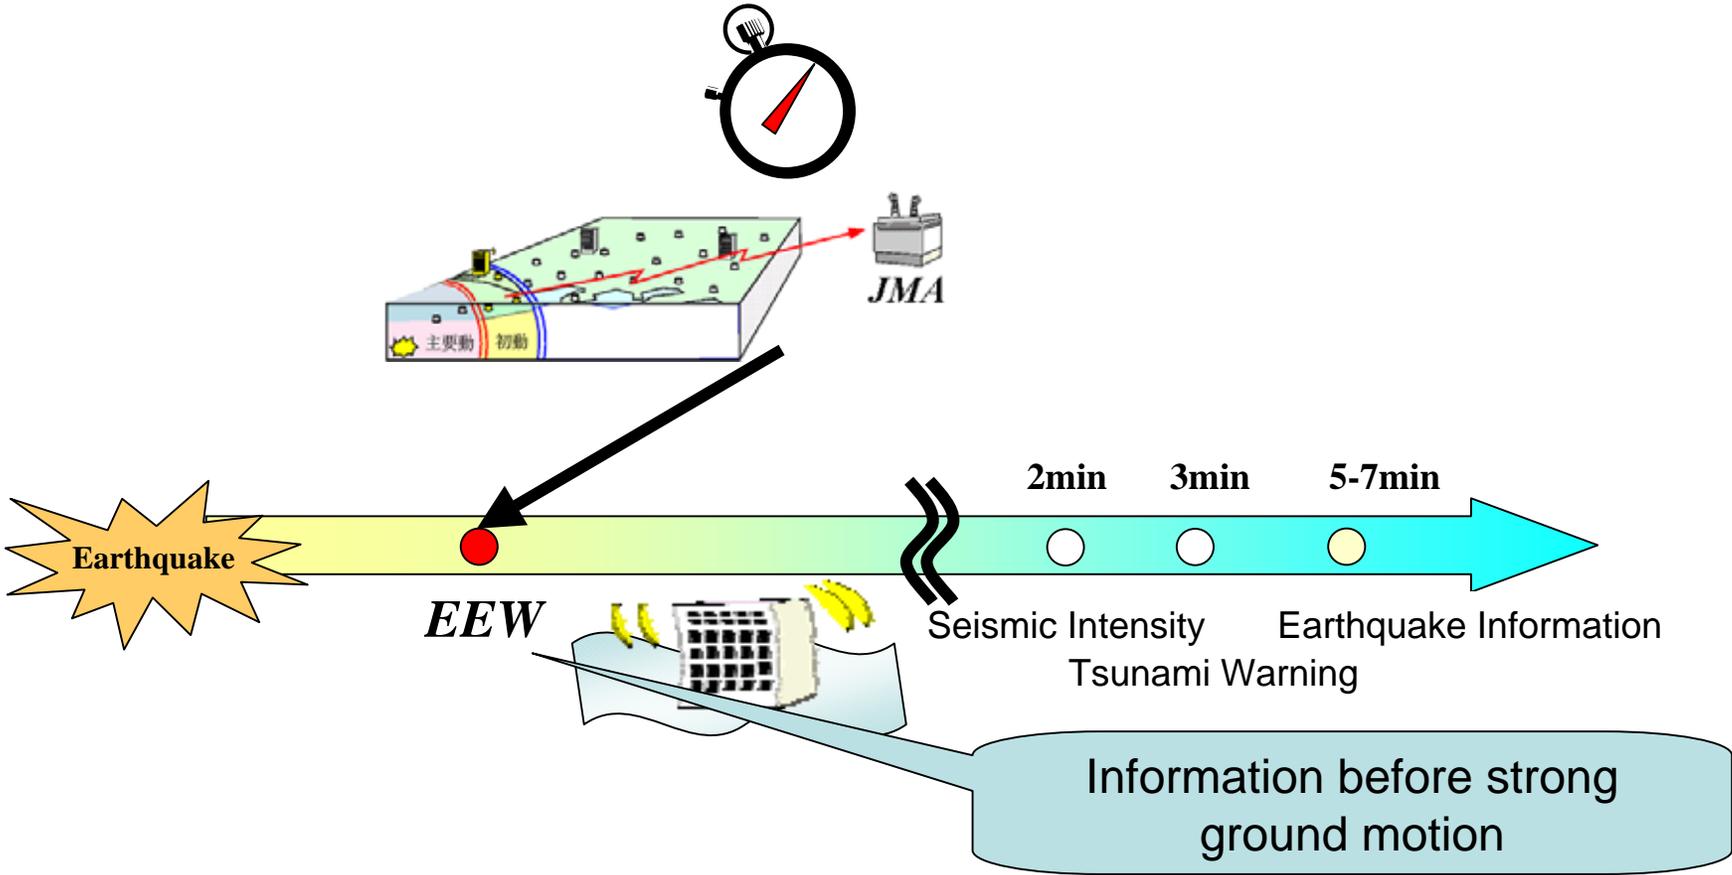

- Origin Time (Time of Earthquake Occurring)
- Epicenter (Area of Earthquake Occurring)
- Area where Strong Shaking are Expected
(Seismic Intensity 4)

From ??? in 2007

- **Basically EEW are Issued once for each earthquake.**

EEW Methods

(Hypocenter, Magnitude, Seismic Intensity)

*Thank you very much for
your kind attention.*
