

# Ecosystem monitoring: vision from Global Land Project

Global Land Project **GLP**  
joint IGBP/IHDP core project  
succeeding GCTE and LUCC  
launched in 2006

Takashi Kohyama

Hokkaido University, JAMSTEC-FRCGC, SC IGBP

- GLP aims to develop research network for integrated understanding of land systems.
- Observation network of ecosystem services, including geochemical flux and biodiversity, provides key information for GLP.
- This comment would outline GLP facilities, particularly Sapporo Nodal Office, for research side counterpart structure of integrated observation networks in the Asia-Pacific region.

# Global Land Project Science Plan

IGBP Report 53 / IHDP Report 19

Global Land Project

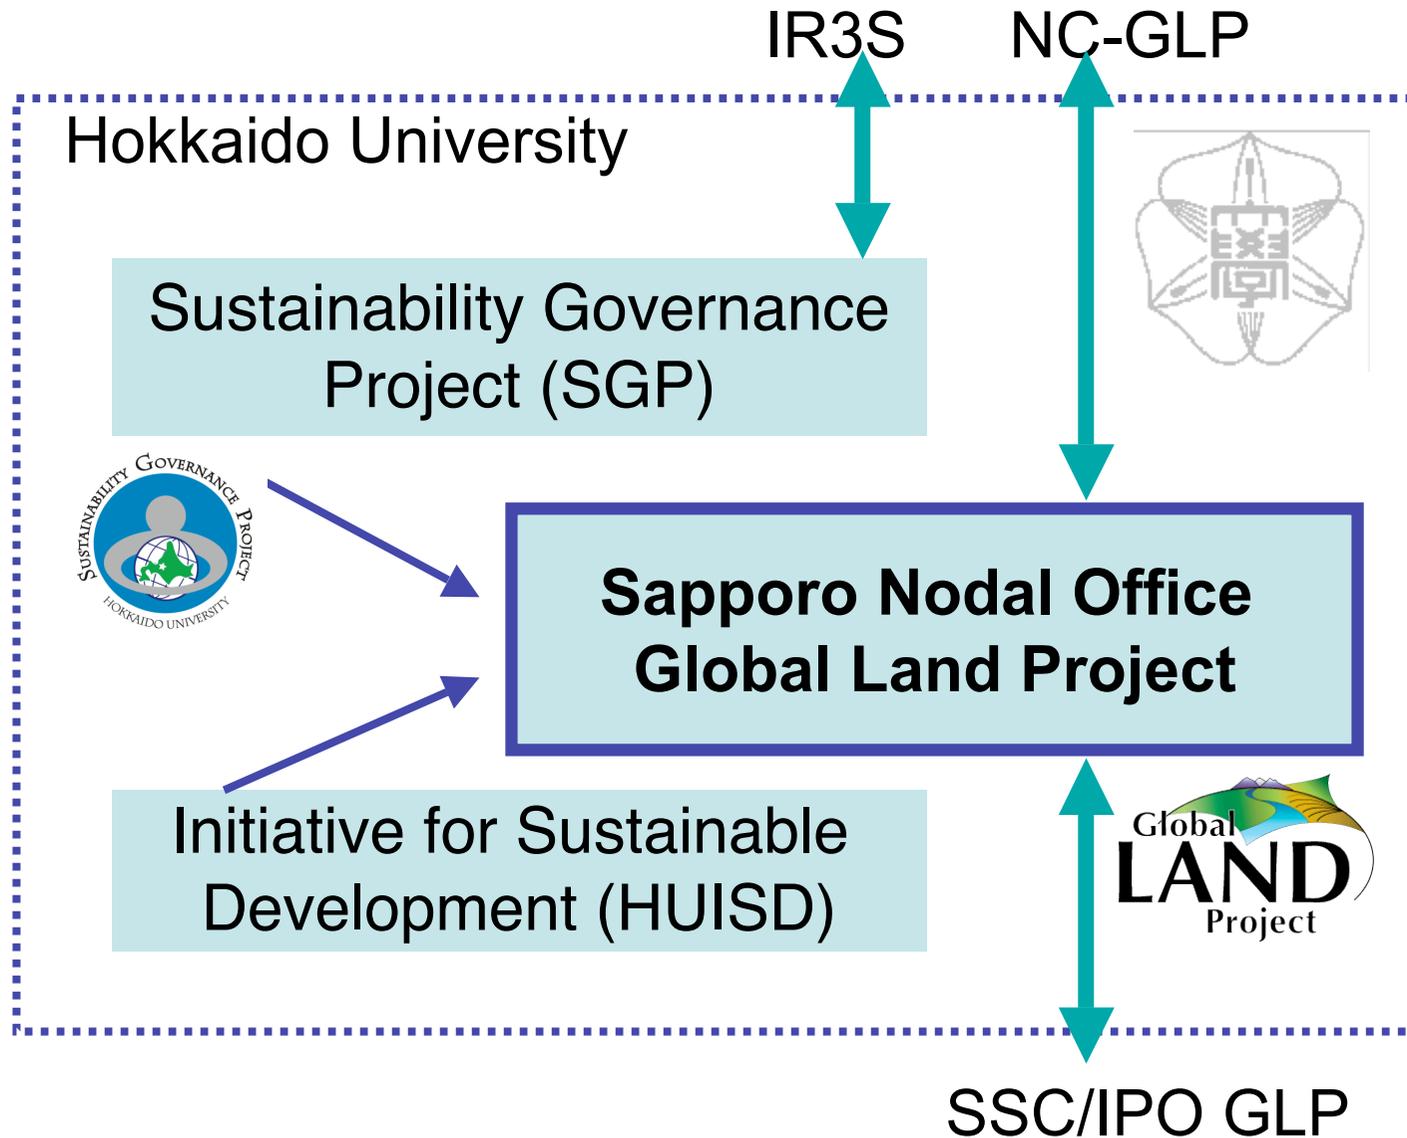

Science Plan and  
Implementation  
Strategy

-  T1. Dynamics of land-systems
-  T2. Consequences of land-system change
-  T3. Integrating analysis and modelling for land sustainability

# Sapporo Nodal Office, GLP

# Thematic foci of Sapporo Nodal Office

## *Vulnerability, resilience and sustainability*

- ❑ Natural ecosystems affected by global warming
- ❑ Freshwater linkage, watershed processes
- ❑ Modeling ecological-human processes at regional scales
- ❑ Restoration and sustainable management of tropical regions
- ❑ Training, education and capacity building

Dr Ademola Braimoh  
Executive Director of Sapporo Nodal Office (Nov. 2006-)

## Sapporo Office Brochure

## International workshops:

20 Feb 2007

26-28 Feb 2007

....

### Fast-track activities

A number of fast track activities are ongoing at the Sapporo Nodal Office of the GLP.

1. Comparative/meta analyses of land systems vulnerability assessment across world regions will be made.
2. Indicators of resilience and vulnerability of land systems comprising biophysical and social variables will be developed
3. We will hold a workshop on *Governance and Land systems sustainability*. Institutions, actors and scales of land system governance will be discussed.
4. A network of ongoing international collaboration on GLP thematic issues will be established.

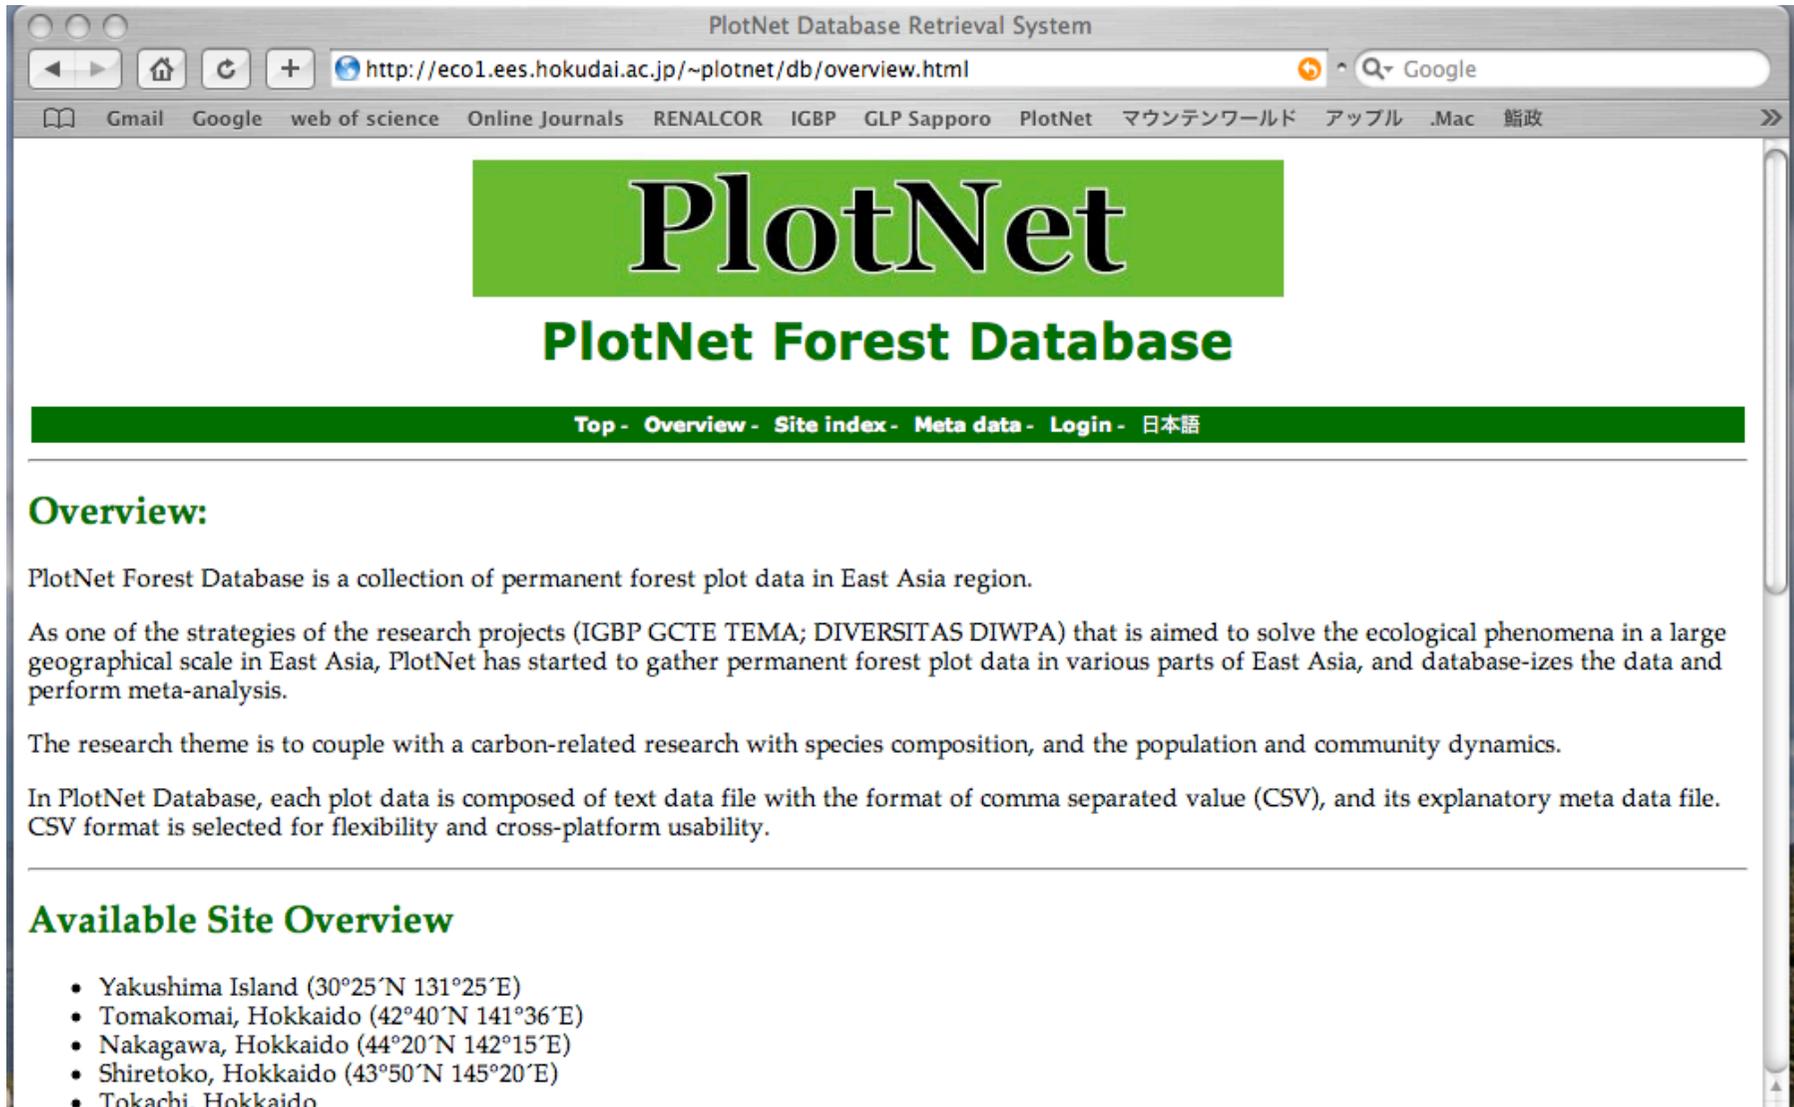

Sapporo Nodal Office

Brief Information

An example of research-based network relevant to GLP:  
PlotNet: database, and meta analysis of East Asian forest plots

PlotNet Database Retrieval System

http://eco1.ees.hokudai.ac.jp/~plotnet/db/overview.html

PlotNet Forest Database

Top - Overview - Site index - Meta data - Login - 日本語

### Overview:

PlotNet Forest Database is a collection of permanent forest plot data in East Asia region.

As one of the strategies of the research projects (IGBP GCTE TEMA; DIVERSITAS DIWPA) that is aimed to solve the ecological phenomena in a large geographical scale in East Asia, PlotNet has started to gather permanent forest plot data in various parts of East Asia, and database-izes the data and perform meta-analysis.

The research theme is to couple with a carbon-related research with species composition, and the population and community dynamics.

In PlotNet Database, each plot data is composed of text data file with the format of comma separated value (CSV), and its explanatory meta data file. CSV format is selected for flexibility and cross-platform usability.

### Available Site Overview

- Yakushima Island (30°25'N 131°25'E)
- Tomakomai, Hokkaido (42°40'N 141°36'E)
- Nakagawa, Hokkaido (44°20'N 142°15'E)
- Shiretoko, Hokkaido (43°50'N 145°20'E)
- Tokachi, Hokkaido

*A fast-track activity of GLP*

## **Decreasing uncertainty in predicting biome boundary shifts**

Takashi Kohyama (Sapporo, Japan)

George C. Hurtt (Durham New Hampshire, USA)

Heike Lischke (Birmensdorf, Switzerland)

1st TFM: 20 February 2007, Sapporo

## Rationale

Dynamics of terrestrial ecosystems characterized by sessile plants with life-spans on the order of  $10^0$ - $10^2$  years is relatively slow compared to that of pelagic ecosystems with short lived, mobile primary producers.

Relatively slow dynamics of terrestrial systems, combined with the rapid pace of contemporary climate change, suggests that complex time lags in the response of terrestrial ecosystems.

Pollen analyses suggest that the response of forest tree species to climate change since last glacial maximum is complex, and has not uniform across species.

Important issues with the goal of reducing the uncertainty in predicting the migration of terrestrial biomes:

- (a) the effect of plant population processes and dispersal on migration;
- (b) the effect of spatial heterogeneity, including land use, on dispersal and migration;
- (c) the effect of climate change on soil conditions and through this on plant population processes; and
- (d) methods to incorporate these effects into large scale models like such as DGVM's or CGCM's.

Sapporo Nodal Office GLP welcomes and supports  
all of your activities along GEOSS in Asia Pacific Region
